Earlier downloads and the August USB

Prepared comparison aid. The table measures whole-file matches, which are narrower than matching record content.

Saved download examined	Files	Exact matches	Without exact match
Local March 27 archive	531	480	51
April 21 archive	294	219	75
May 21 archive	120	119	1

Do not add the last column as a missing-record total. Different file versions can contain the same message. Two March MSG nonmatches have same-message-identifier USB counterparts. The 75 April nonmatches include 73 MSG with 59 distinct identifiers and two PDFs.

Two identified comparison examples

The Mark Miller DPS delivery-failure family concerning case 25-15902 is in the local March 27 ZIP. The Schneider email is Keith Kaiser's November 3, 2025 email to Erin Marshall in the May 21 ZIP. Neither control was located by whole-file identity or the reviewed outer/embedded email identifiers in the USB.

Kyle retains those earlier records. This is a difference between identified productions, not proof that he lacks the earlier copies or that the City destroyed records. Sensitive police-report contents are not reproduced here.

Access history

Kyle reports first seeing files in the April folder after the April 21 email. The April folder name was not visible to him in the newer August link or USB arrangement. A missing folder name or a failed link does not alone establish missing underlying content.

Source limitation: the local March 27 archive was examined; the online-only cloud ZIP supplied later was not independently read or matched. The exact comparison sources and limits are preserved in the AD notes.
