Selected call windows: results and limits

This sheet reproduces the selected results and limits of the retained call-timing screen. It is an analysis summary, not a substitute for the original call rows. The rows for these additional windows have not been individually reconciled in this screen.

The three examples were selected from the broader Council-addressed mailbox collection, outside the subset classified as 28 action/request messages. Email time is the anchor for the analysis, not proof that a telephone record concerns the email.

Email anchor	Unfiltered groups	Comparison median (range)
April 7, 2026 · 08:10	45	24.5 (18–35)
May 28, 2026 · 13:49	42	22.5 (13–39)
June 23, 2026 · 11:57	40	25 (13–30)

After excluding records shorter than 30 seconds, April 7 and May 28 fall within their comparison ranges. June 23 remains slightly above: 16 groups against a comparison range of 5–15.

April 7 and June 23 have overlapping email windows. Related November 12–13 increases are close to the phone-system transition and have only five comparison dates, including holiday or low-activity dates. These limits prevent treating the selected increases as independent incidents or proof of a response to the emails.

Source: retained Call Log Timeline and Escalation Audit, section “Other correspondence,” and the underlying explorer-derived comparison. This reading sheet preserves the qualifications recorded in that audit. It does not establish participants, call content, coordination or causation.
