Aerial map comparison: 2024-2026 layers

SELECTION

Three aerial-map screenshots from Exhibit X. The orange markings are the submitter's approximate annotations; they are preserved. The imagery credits, map controls and displayed layer labels remain visible.

SOURCE CHECK

All three underlying images match the dated redacted EagleView comparison PDF in the supplied folder. The black browser-header redactions are already part of the image pixels. This copy flattens the visible markings and removes editable annotations and hidden PDF objects.

DATES

The displayed layers are labelled 2024, 2025 and 2026. A layer year is not an exact flight, construction or screenshot date. This review does not independently authenticate the aerial provider's capture dates.

LIMITS

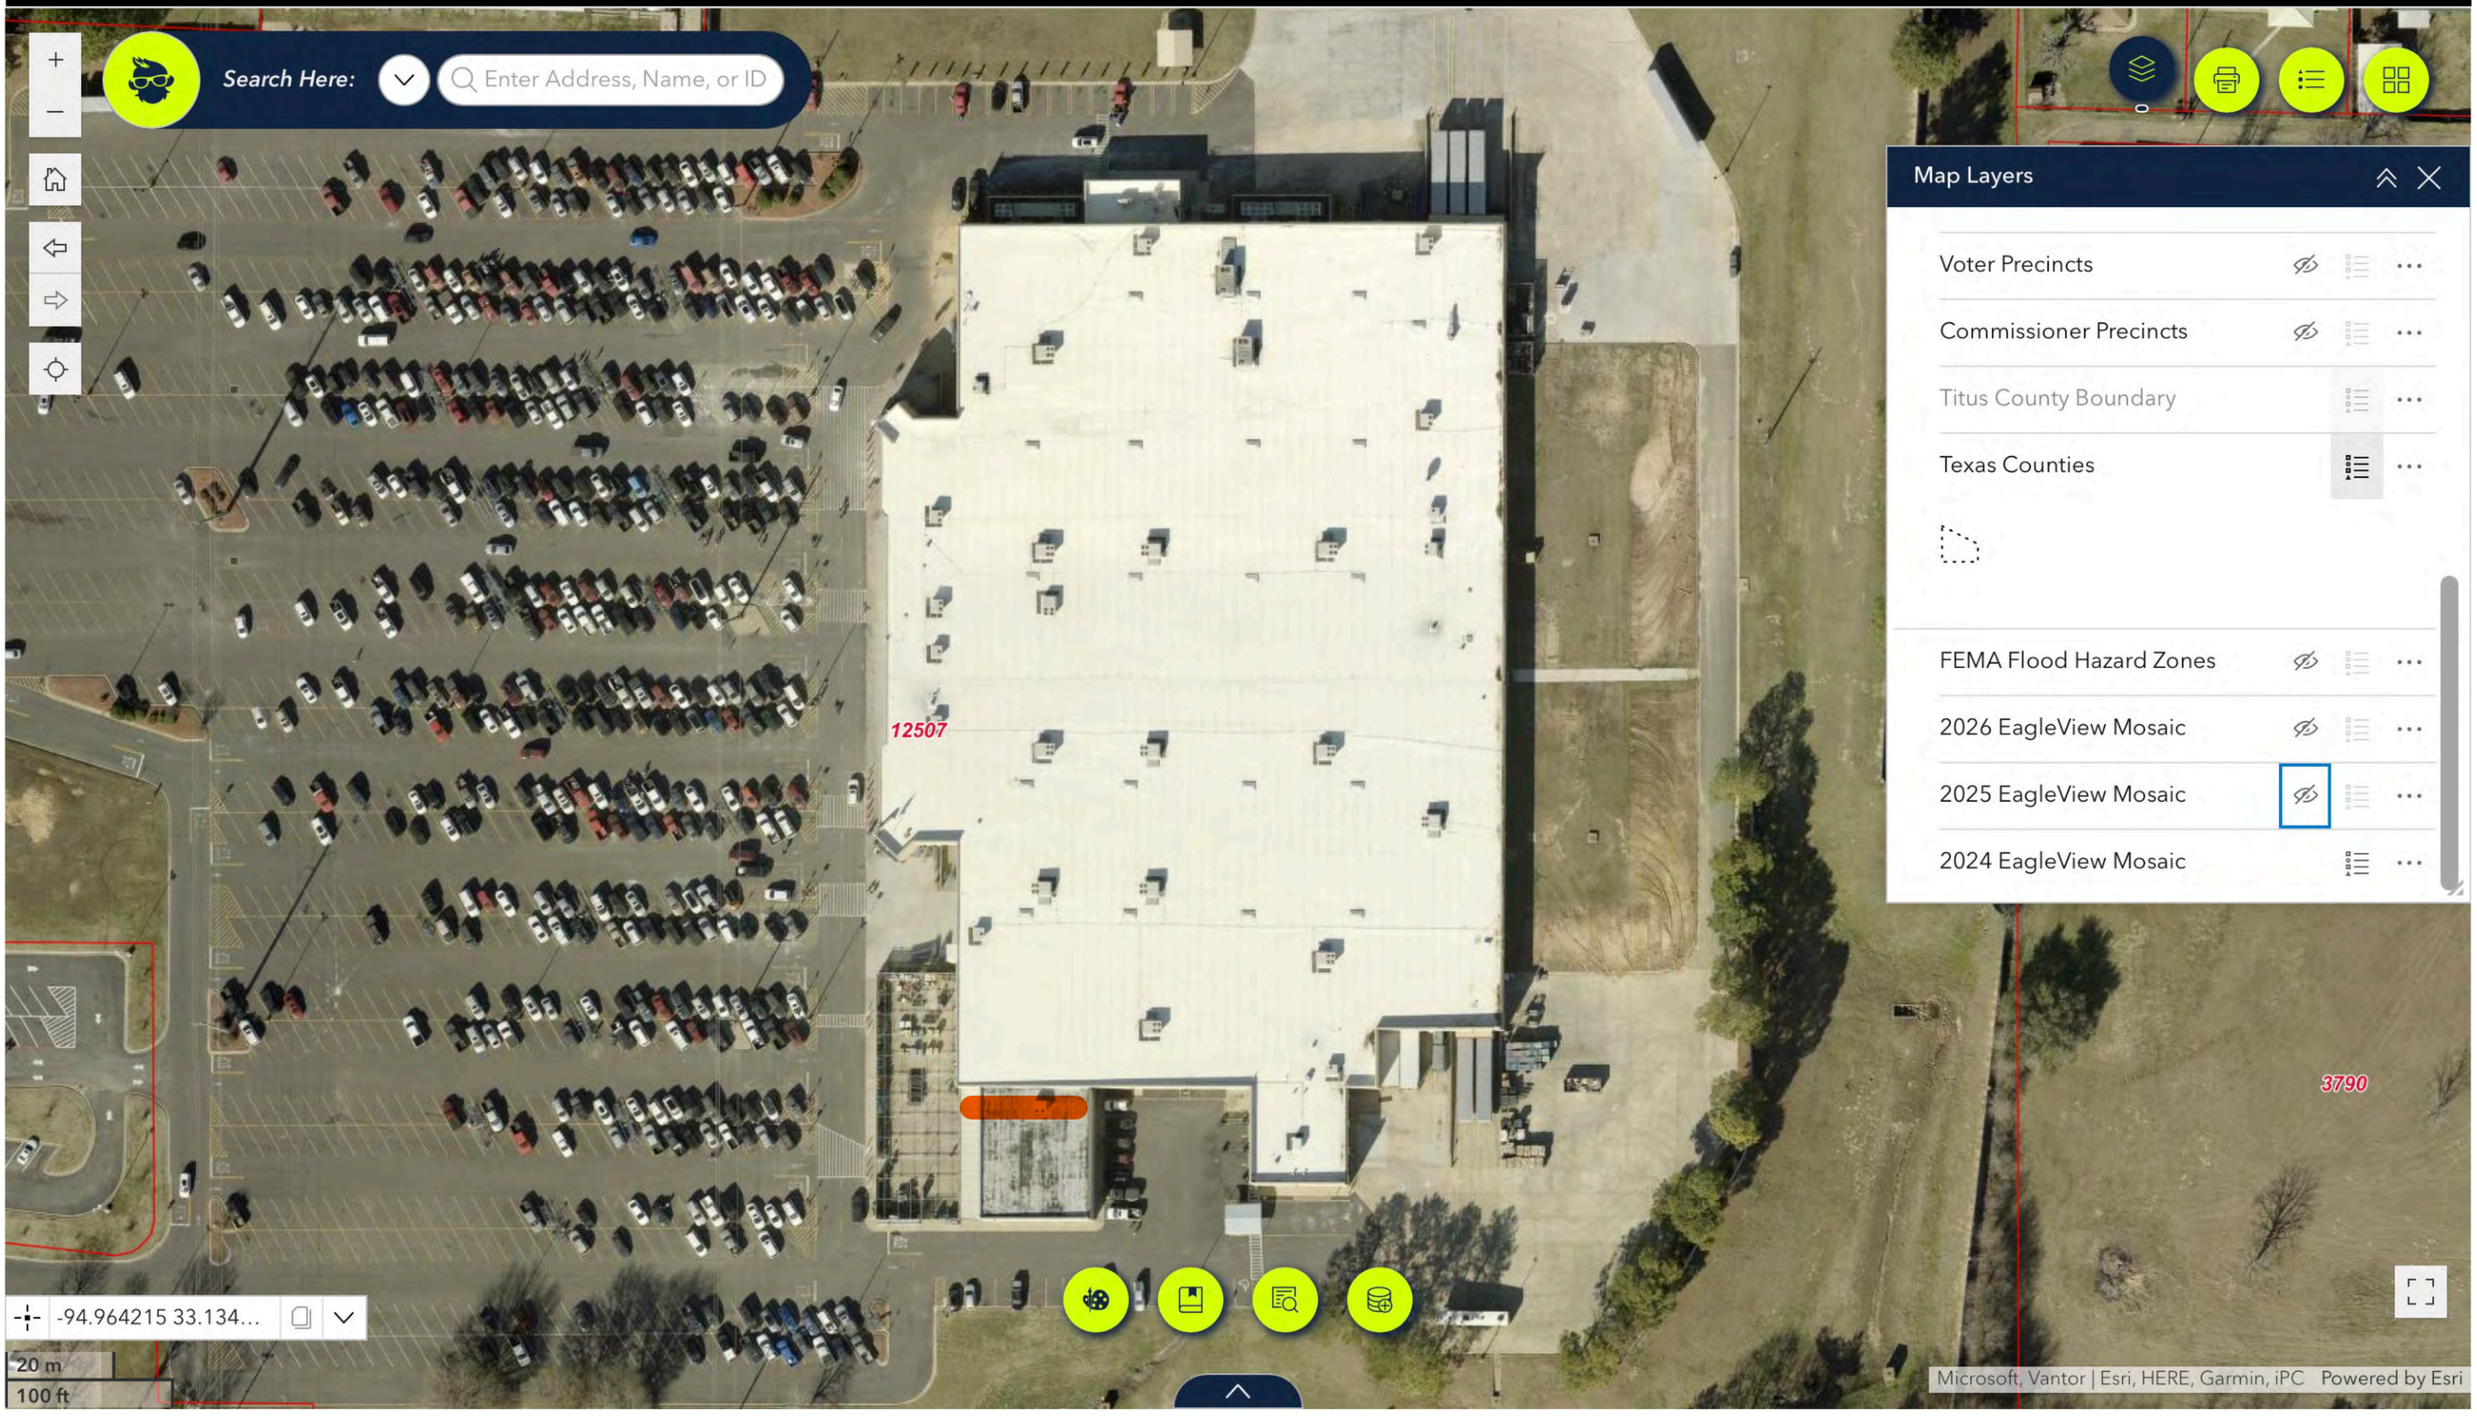

The views show changes in roof appearance. They do not locate asbestos precisely, establish when work occurred, prove asbestos disturbance, or establish abatement status.

LATER AGENCY EXPLANATION

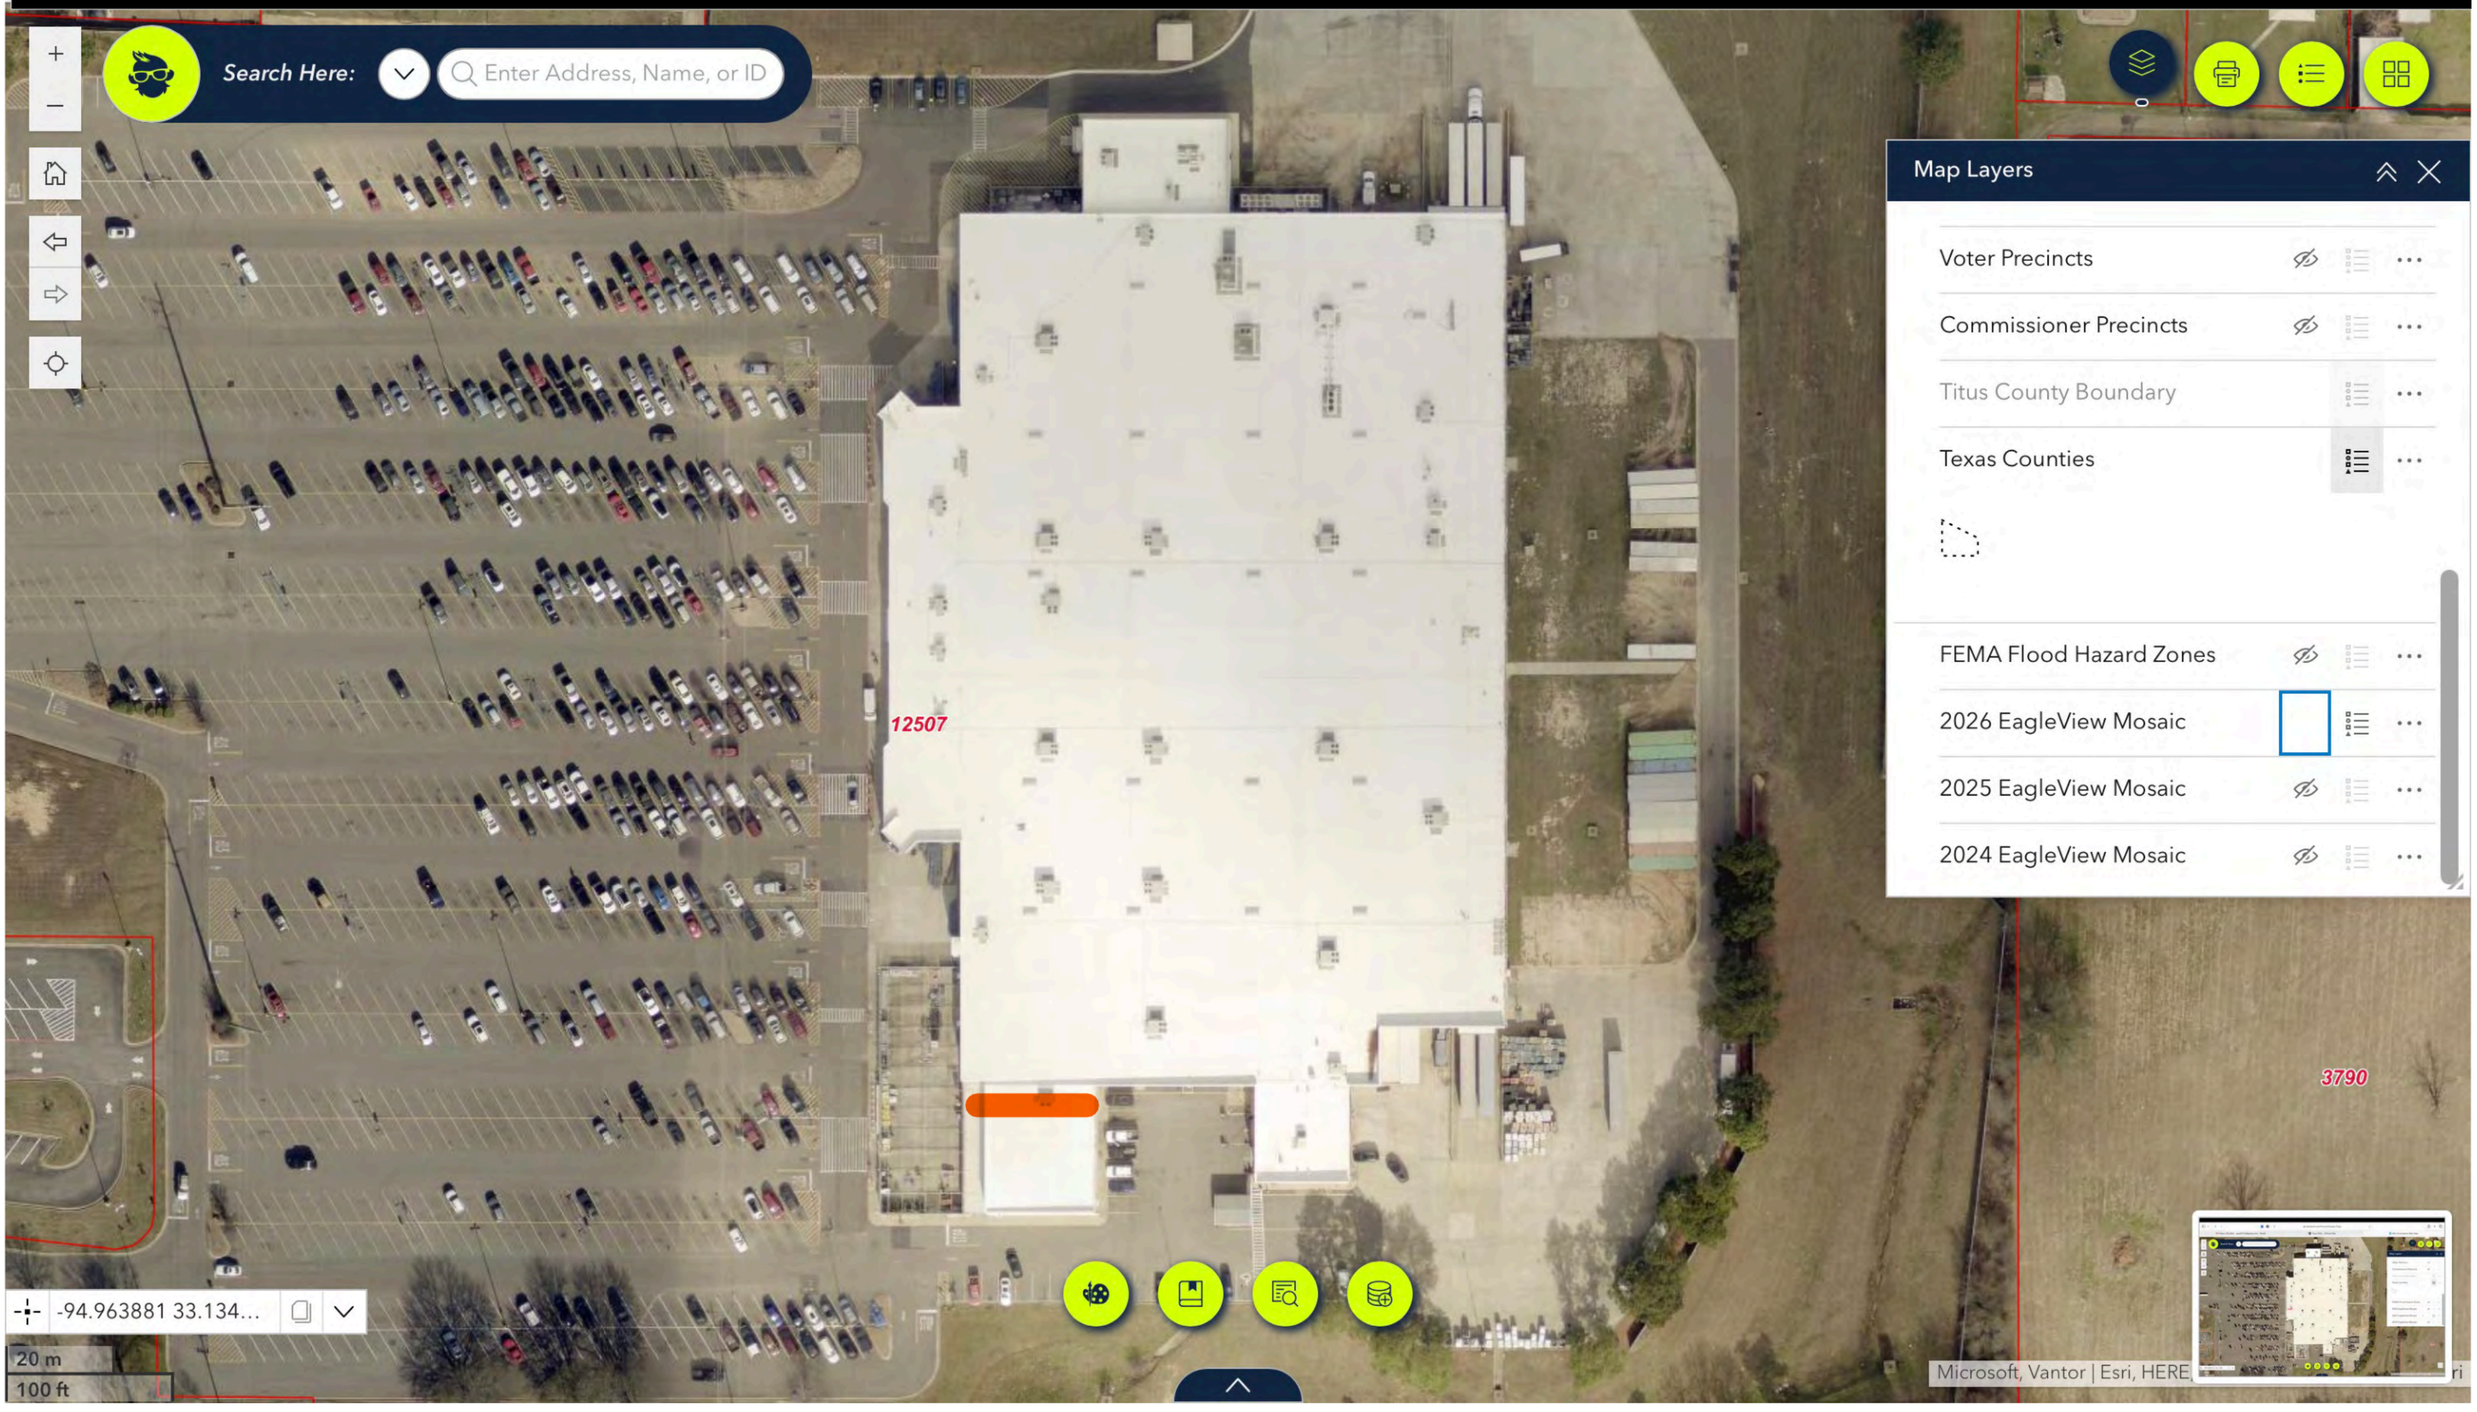

DSHS's September 3, 2026 response reports that asbestos-positive flashing was outside the then-current work area. DSHS issued the survey-related NOV and said the evidence did not establish that previously removed material contained asbestos or supported a notification violation. These limits accompany the earlier allegations.

Source binder: EPA-RAW-9cfc9899; PDF pages 17, 18, 19.

Original page labels retained. The complete binder and unselected media remain outside this copy.
